;  $-x - (R_6)_0$ 

- X is oxygen; sulfur; CH<sub>2</sub>; or NR<sub>7</sub>;
- o is 0; 1; 2; or 3;
- R<sub>6</sub> radicals independently of one another are C<sub>1</sub>-C<sub>4</sub>alkyl; halogen; C<sub>1</sub>-C<sub>4</sub>haloalkyl; C<sub>1</sub>-C<sub>4</sub>haloalkoxy; C<sub>1</sub>-C<sub>4</sub>alkoxy; nitro; cyano; C<sub>1</sub>-C<sub>4</sub>alkoxycarbonyl; amino; mono-C<sub>1</sub>-C<sub>4</sub>alkylamino; or di-C<sub>1</sub>-C<sub>4</sub>alkylamino; and
- $R_7$  is hydrogen;  $C_1$ - $C_4$ alkyl; formyl; or  $C_1$ - $C_4$ alkylcarbonyl; or the acid addition salts thereof.

Suitable acids for forming such acid addition salts are both organic and inorganic acids. Examples of such acids are, inter alia, hydrochloric acid, hydrobromic acid, nitric acid, various phosphoric acids, sulfuric acid, acetic acid, propionic acid, butyric acid, valeric acid, oxalic acid, malonic acid, maleic acid, fumaric acid, lactic acid, tartaric acid or salicylic acid.

Because of their chemical constitution, the compounds of the formula I can exist in the tautomeric equilibrium forms I = I' = I'':

Moreover, certain substituents  $R_1$  to  $R_7$ , on their own or in combination with each other or in combination with the skeleton to which they are bonded, can have centres of chirality.

The invention extends to the racemate as well as to the enriched and optically pure forms of the stereoisomers in question.

In the processes described in the present application, the asymmetrically substituted compounds of the formula I are generally obtained in the form of racemates, unless chiral educts are used. The stereoisomers can then be isolated by methods known per se, such as fractional crystallisation following salt formation with optically pure bases, acids or metal complexes, or, alternatively, by chromatographic methods on the basis of their physicochemical properties.

The compounds of the formula I in which the radicals  $R_2$  and  $R_3$  are alkyl, alkenyl or alkynyl radicals are derivatives of the pyrazolidine-3,5-dione system. In those cases in which  $R_2$  and  $R_3$  are a saturated or partially unsaturated  $C_4$ -carbon bridge, formula I is based on the ring system of the 1H-pyrazolo[1,2-a]pyridazine, and in those cases in which  $R_2$  and  $R_3$  are a saturated or partially unsaturated  $C_3$ -carbon bridge, it is based on the ring system of 1H,5H-pyrazolo[1,2-a]pyrazole. The individual ring positions are numbered analogously to Chemical Abstracts:

1H-pyrazolo[1,2-a]pyridazine

1H,5H-pyrazolo[1,2-a]pyrazolc

In this context, pyrazolidine-3,5-diones of the formula I which must be particularly emphasised are those in which  $R_2$  is methyl and  $R_3$  is methyl or ethyl, or  $R_2$  and  $R_3$ together are -(CH<sub>2</sub>)<sub>3</sub>-, -(CH<sub>2</sub>)<sub>4</sub>- or -CH<sub>2</sub>-CH-CH-CH<sub>2</sub>.

Pyrazolidine-3,5-diones of the formula I which must be particularly emphasised are furthermore those in which R<sub>1</sub>can be the following group:

-CH<sub>2</sub>-CH-CH-CH<sub>2</sub> and R<sub>1</sub> is 2-naphthyl or CH<sub>3</sub>CH<sub>3</sub>

in which,

 $R_9$  is chlorine;  $C_1$ - $C_2$ alkyl;  $C_1$ - $C_2$ haloalkyl;

R<sub>10</sub> is hydrogen; chlorine; fluorine; C<sub>1</sub>-C<sub>2</sub>alkyl or C<sub>1</sub>-C<sub>2</sub>haloalkyl; and

R<sub>11</sub> is hydrogen; fluorine; chlorine or methyl.

The compounds of the formula I are herbicidally active. As herbicides, the active ingredients of the formula I are generally used successfully at rates of application of 0.001 to 5 kg/ha, in particular 0.005 to 3 kg/ha. The dosage rate required for the desired action can be determined by experiments. It depends on the type of action, the development stage of the crop plant and of the weed, as well as on the application (location, time, method) and, due to these parameters, can vary within wide ranges.

When used at low rates of application, the compounds of the formula I are distinguished by growth-inhibiting and selectively herbicidal properties which make them outstandingly suitable for use in crops of useful plants, in particular in cereals, cotton, soybeans, rapeseed oil, maize and rice.

It has now been found that the compounds of the formula I according to the invention are valuable active ingredients in pest control while being well tolerated by warm-blooded species, fish and plants. The application of the active ingredients according to the invention particularly relates to insects and arachnids which can be found in useful plants and ornamentals in agriculture, in particular in cotton, vegetable and fruit crops, in the forest, in the protection of stored goods and materials as well as in the hygiene field, in particular on domestic animals and productive livestock. They are active against all or individual stages of development of normally sensitive, but also resistant, species. In this context, they may unfold their activity through immediate destruction of the pests or only after some time, for example during moulting, or through reduced oviposition and/or hatching rate. As insecticides and acaricides, the active ingredients of the formula I are generally used at concentrations between 0.1 and 1000 ppm, preferably between 0.1 and 500 ppm. The rates of application per hectare are generally 1 to 2000 g of active ingredient per hectare, preferably 10 to 10000 g/ha, in particular 20 to 600 g/ha. The level of rates and concentrations of application for achieving an insecticidal and acaricidal pest control effect is much lower than is the case when these active ingredients are used as herbicides.

This means that damage of the treated useful plants is not possible when the active ingredients of the formula I are used as insecticides/acaricides within the teaching according to the invention.

The good pesticidal activity of the compounds of the formula I according to the invention corresponds to a mortality rate of at least 50-60 % of the abovementioned pests.

The effectiveness of the compounds according to the invention and of the compositions containing them can be substantially widened and adapted to the prevailing circumstances by adding other insecticides and/or acaricides. Examples of suitable additional substances are representatives from the following classes of active ingredients: organophosphorus compounds, nitrophenols and derivatives, formamidines, ureas, carbamates, pyrethroids, chlorinated hydrocarbons and Bacillus thuringiensis preparations.

The compounds of the formula I are used in unaltered form or, preferably, together with the auxiliaries conventionally used in the art of formulation, and they can therefore be processed in a known manner to give emulsifiable concentrates, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granules and also encapsulations in polymeric substances. The methods of application such as spraying, atomising, dusting, scattering or pouring, as well as the compositions, are selected to suit the intended aims and the prevailing circumstances. The compounds of the formula I are futhermore also suitable for use in the treatment of seed. In this context, the seed can be treated or dressed with the active ingredient or with a formulation containing the active ingredient prior to sowing, and the active ingredient can be applied to the furrow during sowing.

#### i) Seed dressing

. .

- a) The seeds are dressed with an active ingredient formulated as a wettable powder by shaking them in a container until the formulation is distributed evenly on the seed surface (dry dressing). Up to 4 g of active ingredient of the formula I are used (in the case of a 50 % formulation: up to 8.0 g of wettable powder) per kg of seed.
- b) The seeds are dressed with an emulsion concentrate of the active ingredient or with an aqueous solution of the active ingredient of the formula I which has been formulated as a wettable powder, following method a) (wet dressing).

c) The seed is dressed by being immersed for 1 to 72 hours in a liquor containing up to 1000 ppm of active ingredient of the formula I and, if appropriate, the seeds are then dried (seed soaking).

Naturally, seed dressing or treatment of the germinated seedling are preferred methods of application because the treatment with active ingredient is completely directed towards the target crop. As a rule, 4.0 g to 0.001 g of active substance are used per kg of seed, but it is possible to exceed, or remain under, the concentration limits given, depending on the method used, which also allows the addition of other active ingredients or micronutrients (repeated dressing).

### ii) Controlled release of active ingredients

A solution of the active ingredient is applied to mineral granule carriers or polymerised granules (urea/formaldehyde) and allowed to dry. If appropriate, a coating can be applied (coated granules) which allows metered release of the active ingredient over a certain period.

The compounds of the formula I are employed in unaltered form or, preferably, as compositions together with the auxiliaries conventionally used in the art of formulation, and they are therefore processed in a known manner to give, for example, emulsion concentrates, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granules, and also encapsulations, for example in polymeric substances. The application methods, such as spraying, atomising, dusting, scattering or pouring, as well as the type of composition are selected to suit the intended aims and the prevailing circumstances.

The formulations, i.e., the compositions, preparations or combinations containing the active ingredient of the formula I and, if desired, a solid or liquid additive, are prepared in a known manner, for example by intimately mixing and/or grinding the active ingredients with extenders, for example with solvents, solid carriers and, if desired, surface-active compounds (surfactants).

The following are possible as solvents: aromatic hydrocarbons, preferably the fractions  $C_8$ - $C_{12}$ , for example xylene mixtures or substituted naphthalenes, phthalic esters, such as dibutyl phthalate or dioctyl phthalate, aliphatic hydrocarbons, such as cyclohexane or paraffins, alcohols and glycols as well as their ethers and esters, such as ethanol, ethylene

glycol, ethylene glycol monomethyl ether or ethylene glycol monoethyl ether, ketones, such as cyclohexanone, strongly polar solvents, such as N-methyl-2-pyrrolidone, dimethyl sulfoxide or dimethylformamide, and also epoxidised or unepoxidised vegetable oils, such as epoxidised coconut oil or soya oil, or water.

Solid carriers which are generally used, for example for dusts and dispersible powders, are ground natural minerals, such as calcite, talc, kaolin, montmorillonite or attapulgite. To improve the physical properties, it is also possible to add highly-disperse silicas or highly-disperse absorptive polymers. Possible particulate, adsorptive carriers for granules are either porous types, for example pumice, brick grit, sepiolite or bentonite, or non-sorptive carrier materials, such as calcite or sand. Moreover, a large number of pregranulated materials of inorganic or organic nature can be used, such as, in particular, dolomite or comminuted plant residues.

Suitable surface-active compounds are non-ionic, cationic and/or anionic surfactants having good emulsifying, dispersing and wetting properties, depending on the nature of the active ingredient of the formula I to be formulated. Surfactants are also to be understood as meaning mixtures of surfactants.

Anionic surfactants which are suitable can be either so-called water-soluble soaps or water-soluble synthetic surface-active compounds.

Suitable soaps which may be mentioned are the alkali metal salts, alkaline earth metal salts or substituted or unsubstituted ammonium salts of higher fatty acids (C<sub>10</sub>-C<sub>22</sub>), such as the sodium salts or potassium salts of oleic or stearic acid, or of natural mixtures of fatty acids which can be obtained, for example, from coconut or tallow oil. Mention must also be made of the fatty acid methyltaurinates.

However, so-called synthetic surfactants are used more frequently, in particular fatty sulfonates, fatty sulfates, sulfonated benzimidazole derivatives or alkylarylsulfonates.

The fatty sulfates or fatty sulfonates are generally in the form of alkali metal salts, alkaline earth metal salts or substituted or unsubstituted ammonium salts, and generally have an alkyl radical having 8 to 22 C atoms, alkyl also including the alkyl moiety of acyl radicals, for example the sodium or calcium salt of ligninsulfonic acid, of the dodecylsulfuric ester or of a fatty alcohol sulfate mixture prepared from natural fatty acids. This group also

includes the salts of the sulfuric esters and sulfonic acids of fatty alcohol/ethylene oxide adducts. The sulfonated benzimidazole derivatives preferably contain 2 sulfonyl groups and one fatty acid radical having 8 to 22 C atoms. Examples of arylalkylsulfonates are the sodium, calcium or triethanolamine salts of dodecylbenzenesulfonic acid, of dibutylnaphthalenesulfonic acid or of a naphthalenesulfonic acid/formaldehyde condensation product.

Other suitable compounds are the corresponding phosphates, such as the salts of the phosphoric ester of a p-nonylphenol/(4-14)-ethylene oxide adduct or phospholipids.

Suitable non-ionic surfactants are mainly polyglycol ether derivatives of aliphatic or cycloaliphatic alcohols, saturated or unsaturated fatty acids and alkylphenols, which can contain 3 to 10 glycol ether groups and 8 to 20 carbon atoms in the (aliphatic) hydrocarbon radical and 6 to 18 carbon atoms in the alkyl radical of the alkylphenols.

Other non-ionic surfactants which are suitable are the water-soluble polyethylene oxide adducts with polypropylene glycol, ethylenediaminopolypropylene glycol and alkylpolypropylene glycol which have 1 to 10 carbon atoms in the alkyl chain and which comprise 20 to 250 ethylene glycol ether groups and 10 to 100 propylene glycol ether groups. The abovementioned compounds customarily comprise 1 to 5 ethylene glycol units per propylene glycol unit.

Examples of non-ionic surfactants which may be mentioned are nonylphenolpolyethoxyethanols, castor oil polyethylene glycol ethers, polypropylene/polyethylene oxide adducts, tributylphenoxypolyethoxyethanol, polyethylene glycol and octylphenoxypolyethoxyethanol.

Other suitable substances are fatty acid esters of polyoxyethylenesorbitan, such as polyoxyethylenesorbitan trioleate.

The cationic surfactants are mainly quaternary ammonium salts which contain at least one alkyl radical having 8 to 22 C atoms as N-substituent and which have lower halogenated or free alkyl, benzyl or lower hydroxyalkyl radicals as further substituents. The salts are preferably in the form of halides, methylsulfates or ethylsulfates, for example stearyltrimethylammonium chloride or benzyldi(2-choroethyl)ethylammonium bromide.

The surfactants customary in the art of formulation are described, inter alia, in the following publications:

- -"McCutcheon's Detergents and Emulsifiers Annual", Mc Publishing Corp., Glen Rock, New Jersey, 1988.
- M. and J. Ash, "Encyclopedia of Surfactants", Vol. I-III, Chemical Publishing Co., New York, 1980-1981.
- Dr. Helmut Stache "Tensid-Taschenbuch" [Surfactants Guide]", Carl Hanser Verlag, Munich/Vienna 1981.

As a rule, the agrochemical preparations contain 0.1 to 95 %, in particular 0.1 to 80 %, of the active ingredient of the formula I, 1 to 99.9% of a solid or liquid additive and 0 to 25 %, in particular 0.1 to 25 %, of a surfactant.

In particular, preferred formulations have the following composition: (% = per cent by weight)

Emulsifiable concentrates:

While concentrated compositions are often preferred as commercially available goods, the end user will normally use dilute compositions. The use forms can be diluted down to 0.001 % active ingredient. The rates of application are generally 0.001 to 5 kg of a.i./ha, preferably 0.005 to 3 kg of a.i./ha.

The compositions can also contain further additives, such as stabilisers, defoamers, viscosity regulators, binders, tackifiers and also fertilisers or other active ingredients for achieving specific effects.

The examples which follow illustrate the invention.

#### Preparation Examples

## H.1.2-(2,4,6-trimethylphenylacetyl)-1-ethoxycarbonylhexahydropyridazine

To a solution of 11 g (70 mmol) of ethyl hexahydropyridazine-1-carboxylate and 10.8 ml (70 mmol) of triethylamine in 350 ml of diethyl ether there is added dropwise with stirring at 20-25°C a solution of 13.8 g (70 mmol) of mesityleneacetyl chloride in 100 ml of diethyl ether. The mixture is subsequently stirred for a further 3 hours at room temperature. Precipitated triethyleneamine hydrochloride is then filtered off with suction, and the filtrate is concentrated in vacuo and chromatographed with ethyl acetate/hexane (1:1) on silica gel.

# H.2.2-(2,4,6-trimethylphenyl)-5,6,7,8-tetrahydro-1H-pyrazolo[1,2-a]pyridazine-1,3(2H)-dione

3.69 g (88 mmol) of a 60 % suspension of sodium hydride in white oil are introduced into 75 ml of toluene. To this mixture there are added dropwise at room temperature 22.3 g (70 mmol) of a solution of

2-(2,4,6-trimethylphenylacetyl)-1-ethoxycarbonylhexahydropyridazine in 75 ml of toluene, and the mixture is heated at the boil for 6 hours. 10 ml of ethanol are then added dropwise with ice-cooling, the reaction mixture is evaporated to dryness in vacuo, and the residue is dissolved in 200 ml of 1N NaOH. The product is precipitated from the resulting solution by adding concentrated hydrochloric acid at 0°C. The crude product is purified by recrystallisation from chloroform/hexane.

### Biological examples

### Example B 1: Pre-emergence herbicidal action

In the greenhouse, the test plants are sown in pots, and the soil surface is then immediately treated with an aqueous dispersion of the active ingredients, obtained from a 25 % emulsion concentrate, at a rate of application of 4 kgAS/ha. The pots are kept in the greenhouse at 22-25°C and 50-70 % relative atmospheric humidity, and the test is evaluated after 3 weeks.

The herbicidal action is evaluated by comparison with the untreated control group, using a 9-step rating key (1 = total damage of the test plant, 9 = no herbicidal action on the test plant).

Rating figures of 1 to 4 (in particular 1 to 3) suggest a good to very good herbicidal action.

In this test, the compounds of Tables 1 to 14 show good herbicidal action. The results for compound No. 1.010 are compiled in Table 15:

## Example B2 Post-emergence herbicidal action

A number of weeds, both monocotyledon and dicotyledon, are sprayed after emergence (in the 4- to 6-leaf stage) with an aqueous dispersion of the active ingredient at a dosage rate of 4 kgAS/ha, and the plants are maintained at 24 to 26°C and 40 to 60 % relative atmospheric humidity. The test is evaluated 15 days after the treatment.

The herbicidal action is rated analogously to Example B1.

In this test, the compounds of Tables 1 to 14 show good herbicidal action. The results for compound No. 1.010 are compiled in Table 16:

## B3 Herbicidal action against weeds in paddy rice

The aquatic weeds are sown in plastic beakers (surface area 60 cm<sup>2</sup>, volume 500 ml). After sowing, the beakers are filled with water up to the soil surface. 3 days after sowing, the water level is increased to just above the soil surface (3-5 mm). Application is effected 3 days after sowing by spraying the containers with an aqueous dispersion of the test

substance. The dosage rate corresponds to a rate of application of 4 kgAS/ha (amount of spray mixture: approx. 550 l/ha).

The beakers with the plants are placed in a greenhouse under optimum growth conditions for the rice weeds (at 25 - 30°C and high atmospheric humidity).

Depending on the growth rate and plant species, the tests are evaluated 2-3 weeks after application. Rating is effected analogously to the rating key mentioned in Example 1.

In this test, the compounds of Tables 1 to 14 show good herbicidal action. The results of compound No. 1.010 are compiled in Table 17:

### **B4** Action against Nilaparvata lugens

Rice plants are treated with an aqueous emulsion spray mixture containing 400 ppm of the active ingredient. After the spray coating has dried on, the rice plants are populated with cicada larvae of stage 2 and 3. The test is evaluated after 21 days. The percentage reduction of the population (% action) is determined by comparing the number of surviving cicadas on the treated with those on the untreated plants.

In this test, the compounds of Tables 1 to 14 show a good action against Nilaparvata lugens. In particular Compounds 1.010 and 1.015 show an action of more than 80 %.

### **B5** Action against Nephotettix cincticeps

Rice plants are treated with an aqueous emulsion spray mixture containing 400 ppm of the active ingredient. After the spray coating has dried on, the rice plants are populated with cicada larvae of stage 2 and 3. The test is evaluated after 21 days. The percentage reduction of the population (% action) is determined by comparing the number of surviving cicadas on the treated with those on the untreated plants.

In this test, compounds of Tables 1 to 14 show a good action against Nephotettix cincticeps. In particular compound 1.010 shows an action of more than 80 %.

#### B6 Action against Bemisia tabaci

Dwarf bean plants are placed in gauze cages and populated with Bemisia tabaci adults (whitefly). After oviposition, all adults are removed, and, after 10 days, the plants together with the nymphs are treated with an aqueous emulsion spray mixture of the active ingredients to be tested (concentration 400 ppm). The test is evaluated 14 days after application of the active ingredient by calculating the percentage hatching rate compared with the untreated control batches.

In this test, compounds according to Tables 1 to 14 show a good action against Bemisia tabaci. In particular, compounds 1.010, 1.015 and 1.086 show an action of more than 80 %.

### B7 Action against Tetranychus urticae

Young bean plants are populated with a mixed population of Tetranychus urticae and, after 1 day, sprayed with an aqueous emulsion spray mixture containing 400 ppm of the active ingredient. The plants are subsequently incubated for 6 days at 25°C and then evaluated. The percentage reduction of the population (% action) is determined by comparing the number of dead eggs, larvae and adults on the treated plants with those on the untreated plants.

In this test, compounds of Tables 1 to 14 show a good action against Tetranychus urticae. In particular, compounds 1.002, 1.003, 1.004, 1.005, 1.006, 1.010, 1.012, 1.014, 1.015, 1.016, 1.086, 1.125, 2.008, 3.010, 3.015, 6.010, 10.010 and 14.001 show an action of more than 80%.

### B8 Action against Tetranychus urticae

Young bean plants are populated with a number of female Tetranychus urticae, which are removed after 24 hours. The plants which are populated with eggs are sprayed with an aqueous emulsion spray mixture containing 400 ppm of the active ingredient. The plants are subsequently incubated for 6 days at 25°C and then evaluated. The percentage reduction of the population (% action) is determined by comparing the number of dead eggs, larvae and adults on the treated plants with those on the untreated plants.

In this test, compounds of Tables 1 to 14 show a good action against Tetranychus urticae. In particular, compounds 1.002, 1.003, 1.004, 1.005, 1.006, 1.010, 1.012, 1.014, 1.015, 1.016, 1.086, 1.125, 2.008, 3.010, 3.015, 6.010, 10.010 and 14.001 show an action of more than 80 %.

# B9 Action against Panonychus ulmi (OP- and carb-resistant)

Apple seedlings are populated with a number of adult female Panonychus ulmi. After seven days, the infected plants are sprayed to drip point with an aqueous emulsion spray mixture containing 400 ppm of the test compound and grown in the greenhouse. The test is evaluated 14 days later. The percentage reduction of the population (% action) is determined by comparing the number of dead spider mites on the treated plants with those on the untreated plants.

In the above test, compounds of Tables 1 to 14 show a good action. In particular, compounds 1.002, 1.004, 1.010, 1.012, 1.014, 1.015, 1.016 and 1.086 show an action of above 80 %.
